

Wet Pour Rubber

Vibrant And Impact Absorbing Rubber Surfaces

Wet pour rubber is an **attractive, impact absorbing** and **low maintenance** rubber crumb safety surface which is most commonly used as the flooring around playgrounds, parks and other recreational areas thanks to its **fantastic critical fall height**. This two layered system is created using an SBR sub-base topped with a coloured EPDM layer to create a **vibrant** and **safe** surface which cures after around 24-48 hours dependent on the outside temperature. Wet pour is created by mixing together a coloured EPDM rubber and a wet pour specific resin binder in a forced action mixer to create a material which can then be easily spread, levelled and finished off using trowels. Skilled installers are also able to provide you with graphics on your safety flooring such as different colours, shapes and even games or logos to meet your needs.
